TITLE : SWITCHING POWER SUPPLY

ABSTRACT : PROBLEM TO BE SOLVED: To avoid reception interference without using a sophisticated shielding means, in the case where the interference is caused by the harmonic wave of a switching frequency which happens to become identical with the receiving frequency of a receiver.

SOLUTION: A voltage-controlled crystal oscillator circuit 14 is used to determine the frequency of a switching power supply. The control voltage of this crystal oscillator circuit 14 is controlled by a CPU 12 which determines the receiving frequency of a receiver 10. The CPU 12 controls the oscillating frequency of the crystal oscillator circuit 14 via a voltage setting circuit 11 in such a way that the harmonic wave frequency of the switching frequency does not become identical with the receiving frequency of the receiver 10.
